Inb4 it's all genetics. 😏

<http://www.ncbi.nlm.nih.gov/pubmed/17090153>

Effects of growth hormone on craniofacial growth.

Quote:

Abstract

OBJECTIVE:

This study determined the effects of growth hormone (GH) therapy on craniofacial growth in idiopathic growth hormone deficiency (GHD).

MATERIALS AND METHODS:

Fifty-seven patients (33 boys and 24 girls; age range 4.5 to 16.7 years) with GHD were investigated and categorized into three groups according to the duration of GH therapy: the untreated group, the short-term therapy group, and the long-term therapy group. Their lateral cephalometric radiographs were studied, and craniofacial measurements were assessed by age and sex by using matched standard deviation scores.

RESULTS:

In the untreated group, the anterior cranial base, total facial height, maxillary length, mandibular total length, mandibular body length, and ramus height were smaller than the standard values. In comparison with the untreated group, the long-term therapy group had a significantly larger upper facial height (P < .05), maxillary length (P < .01), and ramus height (P < .01) measurements.

CONCLUSIONS:

Children who received long-term GH replacement therapy showed increased growth of the craniofacial skeleton, especially the maxilla and ramus. These findings suggest that GH accelerates craniofacial development, which improves occlusion and the facial profile.

I had GH tested as a child and it was in "normal" range. Eh.

testosteron dont change the facial bones just the fat distribution i think.

if you use hgh after your growth is finished only some parts of your body will grow (hands, feets, browridge, nose, mandibular) but not for example the maxilla.

this can be watched by people who get acromegaly (very high hgh overdoses over years) post puberty.

@Anakind how can you grow tall but still have tiny hands etc. something i dont understand. both should be affected by hgh

testosteron dont change the facial bones just the fat distribution i think.

if you use hgh after your growth is finished only some parts of your body will grow (hands, feets, browridge, nose, mandibular) but not for example the maxilla.

this can be watched by people who get acromegaly (very high high overdoses over years) post puberty.

Symptoms of acromegaly include a combination of the following:

Specific symptoms include:

- A change in the face, jaw or tongue:
 - Checkbones or forehead are more prominent
 - Bite has changed (inability to bite) or teeth have become more widely spaced
 - Lips and tongue have enlarged causing snoring or dribbling at night
- Enlarged hands and feet - often requiring larger rings or shoe sizes

Other symptoms that suggest acromegaly:

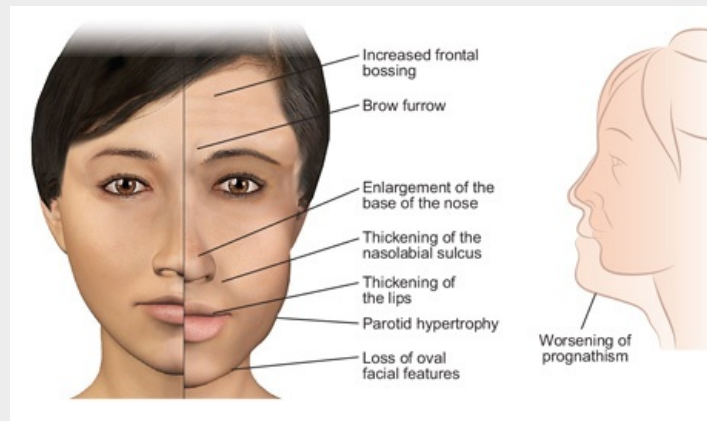

- Excessive sweating
- Heavy snoring or daytime sleepiness
- Tingling/numbness in both hands (carpal tunnel syndrome)
- Skin becoming more oily, thicker and hairier

Other conditions associated with acromegaly:

- Arthritis
- Diabetes
- High blood pressure

For a more detailed list of symptoms visit: [www.pituitary.asn.au](http://www pituitary.asn.au)

If you ticked at least one specific symptom, three or more of the suggestive symptoms and one or more of the associated conditions, visit your doctor and ask for a simple blood test to check for acromegaly. Treatments are available to control the symptoms of acromegaly.

@Anakind how can you grow tall but still have tiny hands etc. something i dont understand. both should be affected by hgh

Legit 🤔👉

Not necessarily beneficial any more. Childhood is where it's at.

Length of my hands is fine. I can easily grab a basketball without problems and dunk it with one hand. But breadth and bone width is below average. There's a lot more to it than just growth hormone though.
